OPAQUE

Governance Record

Workload	Employee HR Assist
Coverage period	2026-04-09 09:00 → 14:32 UTC
Generated by	OPAQUE Attestation Service v3.0
Result summary	✓ All checks passed · Cryptographically signed

Workload identity

Name	Employee HR Assist
Workspace	HR Internal
Version	1.0
Run ID	TRP-2026-04-09-0042

Policies enforced

All policies listed were active and enforced at runtime for the full duration of this execution. Enforcement is hardware-backed where marked — not software policy assertion alone.

Policy	Type	Enforced	Scope
No network egress	Isolation	✓	All pods
TEE required	Hardware	✓	All pods
PII output guardrail	Output	✓	All pods
RBAC session scoping	Access	✓	All pods

Regulatory framework mapping

Each entry maps a regulatory requirement to the specific control enforced during this execution and the section of this document where evidence can be found.

Regulati...	Article	OPAQUE Control	Document
DORA	Art. 9 — ICT secur...	Workload memory is hardware-isolated inside a TEE for the full execution duration; network egress is enforced at the hardware level, not by software policy alone.	Policies Enforced · Workload Verification
DORA	Art. 30 — Third-party ICT contracts	Per-execution cryptographic proof of policy enforcement is generated automatically and independently verifiable by any party using the OPAQUE Root Key.	Signature · Blocked Executions
EU AI A...	Art. 15 — Robustness & cybersecurity	Runtime measurements are compared against registered values at execution time; any deviation triggers workload denial. All enforcement events are tamper-evidently logged.	Workload Verification · Blocked Executions
GDPR	Art. 25 — Data protection by design	Hardware memory isolation and RBAC session scoping are enforced by default on every execution — no configuration can override hardware-level data protection	Policies Enforced · Workload Verification
GDPR	Art. 32 — Security of processing	AMD SEV-SNP encrypts workload memory at runtime. No outbound data transfer is architecturally possible during execution. All events are cryptographically signed and auditable.	Policies Enforced · Signature

Independent certifications: SOC 2 Type II · ISO 27001 · ISO 42001 furnished upon request.

Workload verification

Registered measurements compared against runtime measurements. Identical values confirm the workload ran exactly as approved. Each podVM is a separate execution environment and appears as a separate block.

pod-a8f2 · Azure (AMD SEV-SNP) · US East · 14:30:02 UTC

Layer	Attribute	Registered value	Runtime value	Match

Blocked executions (this coverage window)

Policy enforcement log — the following attempts were detected and blocked by active controls

3 executions blocked • 0 policy violations undetected • All blocked events are tamper-evidently recorded in the Audit Log.

Timestamp	Policy	Pod	Event
18 Mar 2026, 2:31 PM	Network policy	pod-a8f2	Outbound connection to api.openai.com:443 blocked - not in approv...
18 Mar 2026, 2:14 PM	Runtime integrity	pod-c3d1	Attestation failed - container image digest mismatch, workload denie...
18 Mar 2026, 2:11 PM	Network policy	pod-a8f2	Inbound aTLS handshake rejected - claims-analytics-svc did not pre...

What this proves

This is machine-verifiable proof — recorded at runtime, not reconstructed for audit. Each claim maps to a concern raised by risk and compliance teams in pre-purchase review.

- **No one could access your data during processing**
  This workload ran inside a hardware-sealed Trusted Execution Environment. Cloud operators, OPAQUE staff, and privileged admins are excluded from enclave memory at the hardware level — not by policy alone. **See: Workload Verification*
- **Data did not leave the execution environment**
  Network isolation was hardware-enforced throughout this execution. No outbound transfer was possible. All egress controls were active and logged. *See: Policy Enforcement*
- **Shared responsibility model: Access control policies were enforced within execution**
  Data retrieval and all agent tool calls in this execution ran within the scoped access boundary shown. Policies enforced at runtime are documented here. Note: OPAQUE scopes enforcement to this execution; source-system RBAC definitions are set by your org. **See: Policy Enforcement*
- **Training data was processed inside a sealed boundary**
  Model inputs were confined to this execution environment. Egress was blocked by policy. Memorization and regurgitation risk is reduced — not eliminated — and subject to output guardrails beyond this boundary. **See: Workload Verification*
- **This is cryptographic proof, not documentation**
  These results were produced at the time of processing. They describe what happened — not what was intended. The signature is machine-verifiable by any party. Designed to satisfy DORA Art. 9 & 30, EU AI Act Art. 15, and FFIEC AI supervisory expectations. **See: Signature*

** References indicate the section of this document where supporting evidence can be found*
